Experience

Antidote AI *Miami, FL*

Lead Engineer & Co-Founder *January 2021 – Present*

• Owned the company's core platform from prototype through production, helping move the business from pre-seed to paying customers and profitability.
• Built backend services in F#, .NET, Node.js, and Python for APIs, AI workflows, and background processing.
• Created a document ingestion pipeline that processed 16M+ patient records, reducing manual chart review while maintaining HIPAA compliance.
• Built a WebSocket-based recovery system that preserved progress during long-running reviews and significantly improved reliability.
• Replaced hard-coded customer logic with a rules engine and state-machine workflow system, allowing new states, payers, and customers to be onboarded without branching the application.
• Built a document ingestion and analysis pipeline that processed more than 16M patient records, reducing manual chart review effort while maintaining HIPAA compliance.
• Migrated the platform from Azure to Docker and Kubernetes, enabling reliable zero-downtime releases.

SRC Inc.| LogiSolve *Orange, CA*

Software Engineer / Software Consultant March *2020 – December 2025*

• Replaced a largely manual trauma registry submission process with an automated validation and XML generation pipeline, reducing the time required to prepare records for state and national submission while making the process more reliable.
• Identified that large healthcare datasets had become effectively unusable due to multi-minute load times, then introduced indexing, caching, background jobs, server-side paging, and filtering to reduce searches to seconds and make the product practical for daily use.
• Designed and implemented a real-time sports betting platform using live data feeds and WebSocket updates, creating an experience that supported groups of users without requiring page refreshes.
• Introduced Docker, CI/CD, and automated deployment pipelines across multiple teams, shortening release cycles and reducing deployment failures while giving smaller teams more confidence shipping changes.

Scully Leather *Oxnard, CA*

Product Engineer / Software Consultant *July 2018 – March 2020*

• Helped migrate the business from a legacy e-commerce platform to a modern solution by integrating inventory, warehouse, fulfillment, and third-party systems into a single workflow.
• Built the custom extensions, integrations, pricing logic, and business-specific functionality needed to support the company's existing processes without disrupting day-to-day operations.
• Reduced downtime and maintenance effort by more than 90% while improving the reliability and speed of releases.
• Worked directly with the client and internal stakeholders to identify operational pain points, prioritize new functionality, and ensure the platform matched existing business workflows.
• Collaborated with the client's DevOps engineer to containerize the platform and create a deployment process that could be handed off internally after the project was complete.

RepSpark *Orange, CA*

Implementation Consultant / Product Engineer *July 2016 – July 2018*

• Worked directly with customers to understand sales, pricing, and workflow requirements, then translated those needs into custom integrations and product improvements.
• Implemented new product features and pricing workflows that supported more complex customer use cases and reduced the need for manual workarounds.
• Supported releases and customer rollouts by testing new functionality, troubleshooting production issues, and ensuring implementations were delivered successfully.

Skills

Languages:	F#, TypeScript, React, C#, Node.js, Python
Architecture:	Distributed Systems, REST APIs, WebSockets
Infrastructure:	Docker, Kubernetes, Azure, Terraform, CI/CD
Data:	SQL, PostgreSQL, MongoDB, Redis
AI:	OpenAI API, Claude, RAG Systems, Integration, Prompt Engineering

Education

Middletown, NY **SUNY Orange** *Aug 2011- Jun 2013*

- Degree: Associate's
- Major: Computer Science
